

2 5 Optical Transport Network

Overview

An optical transport network (OTN) is a digital wrapper that encapsulates frames of data, to allow multiple data sources to be sent on the same channel. ITU-T defines an optical transport network as a set of optical network. This Technical Paper provides a comprehensive overview of the optical transport network (OTN), which is the current generation technology used in telecommunication networks for transporting various client signals including Ethernet and legacy protocols. The company offers innovative solutions for the development, installation, management and. Described in the ITU-T Recommendation G. 709 (2003), OTN adds operations, administration, maintenance, and provisioning (OAM&P) functionality to optical carriers, specifically in a multi-wavelength system such as dense wavelength division multiplexing (DWDM).
