

35kW Distribution Box Configuration

Article Overview

A 35kW distribution box is configured with a main bus, protective devices, cable terminations, and modular compartments to ensure safe, reliable, and flexible power distribution.

Key Components and Structure

A typical 35kW distribution box includes:

- **Main Bus and Segmentation:** Single or segmented busbars allow flexible operation and maintenance. Segmentation ensures that a fault in one section does not interrupt power to critical loads .
- **Protective Devices:** Circuit breakers, fuses, and current-limiting devices protect both the equipment and personnel. Low-voltage sides often include automatic air switches with under-voltage or over-current protection .
- **Cable Terminations:** European-style cable distribution boxes use wall bushings as connecting busbars, with bolted cable joints rated for 630A, ensuring secure and standardized connections .
- **Enclosure:** Steel or alloy shells with anti-corrosion treatment provide long-term outdoor durability. Two-way openings and clear cable arrangements facilitate installation and maintenance .
- **Monitoring and Control:** Integration of CTs/VTs for metering and protection, along with relay suites for overcurrent, undervoltage, and breaker failure detection, ensures operational safety. SCADA integration via IEC 61850, Modbus, or DNP3 is possible for remote monitoring
