

Alarm Delay of Display Panel

Overview

PLC-to-HMI alarm display is governed by the communication polling cycle, not the alarm detection speed. When a PLC detects an alarm condition, the HMI cannot display it until the next polling update. This creates a minimum response delay determined by the data server. The delay LED is off when delay to output is not set for any zone or if it is set and the delay is less than 1 minute. The. WARNING: Identifies information about practices or circumstances that can cause an explosion in a hazardous environment, which may lead to personal injury or death, property damage, or economic loss. For analog alarms, this means the analog variable needs to fall within a specified range for the duration. Note: Events such as Duress Alarms and Fire Alarms typically bypass the dialer delay and alert the monitoring station immediately.
