

Argentine Fireproof Cable Tray Specifications

Article Overview

Fireproof cable trays in Argentina are typically made from galvanized steel or coated metals, designed to resist fire, environmental factors, and mechanical stress, and comply with international safety standards.

Material and Construction

Fireproof cable trays in Argentina are commonly constructed from cold-dip galvanized steel, which provides excellent corrosion resistance and durability for both indoor and outdoor installations . Some trays are also coated with fire-resistant materials such as FLAMMOTECT-A or DG-CR 0.7, which form a protective shield around cables to prevent flame propagation and maintain functionality during a fire . Trays may be available in standard or lightweight designs, depending on load requirements .

Fire Resistance and Safety Standards

These cable trays are designed to withstand high temperatures and prevent fire spread along cable routes. They are often tested and certified according to international standards, including UL, CSA, and NF certifications, ensuring compliance with safety regulations . Fireproof coatings also enhance resistance to UV radiation, moisture, saltwater, oil, and chemicals, making them suitable for industrial, offshore, and sensitive installations such as hospitals and power plants .
