

Armored pigtail

Article Overview

An armored pigtail is a fiber optic pigtail reinforced with a protective layer, designed to safeguard the fiber from physical damage and harsh environmental conditions.

Definition and Structure

A fiber optic pigtail is a short length of optical fiber with a factory-terminated connector on one end and a bare fiber on the other, intended for fusion or mechanical splicing into a larger fiber network . An armored pigtail adds an extra layer of protection around the fiber, typically using materials like stainless steel or Kevlar, which significantly enhances its mechanical strength and resistance to external hazards . This armor surrounds the standard 0.9mm fiber core, often within a 2.0mm or 3.0mm armored tube .

Advantages

- **Enhanced Durability:** The armored layer protects the fiber from accidental drops, abrasions, and rodent damage .
- **Environmental Resistance:** Suitable for harsh environments such as industrial sites, basements, outdoor installations, and communication towers .
- **Reliable Performance:** Maintains signal integrity by preventing fiber breakage and reducing the risk of network downtime .
- **Flexibility in Deployment:** Allows upgrades or changes without replacing the entire fiber assembly, making it ideal for telecom infrastructures .
