

Assembly Method of Tunnel Cable Tray Support

Article Overview

Tunnel cable tray supports are installed using adjustable consoles, threaded rods, or rock bolts, ensuring proper alignment, load distribution, and compliance with safety standards.

Overview of Tunnel Cable Tray Support

Cable trays in tunnels are designed to carry electrical, communication, and signaling cables safely while accommodating heavy loads, vibration, and long support spans. The support system must allow for continuous operation, easy maintenance, and precise alignment despite irregular tunnel surfaces or unaligned anchor points .

Support Types and Installation

- Concrete Insert Rails and Central Supports
 - Used in cast section tunnels or culverts.
 - Consoles are mounted on concrete inserts to support the cable ladder centrally.
 - Height and lateral adjustments are possible, typically up to 60 mm in height and 20 mm sideways to compensate for misaligned anchors .
- Rock Bolts and Threaded Rods
 - For tunnels with rock surfaces, cable trays can be fixed using rock bolts or threaded rods.
 - Adjustable brackets allow for alignment without repositioning the bolts, simplifying installation in irregular tunnels
