

Benin Long-span Cable Tray Laying

Article Overview

Long-span cable tray installation in Benin requires careful planning, proper material selection, and adherence to international standards to ensure durability, safety, and efficient cable management.

Material Selection and Local Suppliers

For long-span cable trays in Benin, materials must withstand both coastal humidity and inland heat. Common options include galvanized steel, stainless steel, aluminum, and fiberglass-reinforced composites depending on environmental conditions and load requirements. Ned-Tech is a leading supplier in Benin, offering a wide range of cable trays, ladders, trunking, and wire mesh systems suitable for industrial, commercial, and government projects in cities like Cotonou, Porto-Novo, Parakou, and Abomey-Calavi.

Design Considerations

Long-span cable trays require careful load calculation and support spacing. Key factors include:

- Tray width and thickness based on cable quantity and weight
- Rung spacing of 150–230 mm for proper cable support
- Segregation of power and signal cables to minimize electromagnetic interference
- Thermal expansion and contraction allowances for long runs Using calculation modules or design software can help simulate load, cable filling, and structural requirements, ensuring the tray system can safely support the intended cables
