

Cable Tray Production Specifications

Article Overview

Cable tray production and installation are governed by international and national standards such as IEC 61537, NEMA VE 1, UL 568, NEC, and CSA C22.2, ensuring safety, durability, and proper cable support.

International Standards

IEC 61537:2023 specifies requirements and tests for cable tray and ladder systems used to support and accommodate electrical and communication cables. It covers mechanical strength, electrical safety, and installation practices, including the arrangement of cables into groups and the use of trays as protective earth conductors where applicable. This standard is widely adopted globally and serves as a reference for harmonizing national standards.

North American Standards

In the United States and Canada, cable tray production follows NEMA VE 1 for metal trays and NEMA VE 2 for nonmetallic trays. These standards define manufacturing requirements for ladder, ventilated, solid bottom, channel, and wire mesh trays, including load/span classifications, material selection, and associated fittings. Compliance with the National Electrical Code (NEC, NFPA 70) ensures safe installation, while CSA C22.2 Part 1 aligns Canadian installations with NEC guidelines. UL 568 covers performance and safety requirements for fiberglass cable trays.
