

# Cable tray structure composition procedure

## Article Overview

A cable tray structure is composed of tray sections, fittings, supports, and accessories, typically made from steel, aluminum, or wire mesh to provide mechanical support, protection, and routing for cables.

### Main Components

Tray Sections: These are the primary pathways for cables and come in various types:

- Ladder trays: Consist of two side rails connected by rungs, ideal for heavy power cables and excellent ventilation ( ).
  - Perforated trays: Feature a solid base with holes for airflow and drainage, suitable for medium-duty applications ( ).
  - Solid bottom trays: Fully enclosed bases that protect sensitive or data cables from dust and debris ( ).
  - Wire mesh trays: Made of welded steel wires forming a grid, lightweight and flexible, commonly used in data centers ( ).
  - Channel trays: Compact U-shaped trays for smaller cable runs or branch connections ( ).
- Fittings: Used to change direction, create branches, or adapt the tray layout to the building structure. Common fittings include bends, tees, elbows, crossovers, and drop-outs ( ).
- Supports: Provide mechanical stability and carry the load of the tray and cables. Examples include wall brackets, suspended supports, and center suspensions ( ).
- Accessories: Include covers, barrier strips, cable protection rings, and mounting plates for junction boxes or devices ( )....
