

Can a fiber optic router be converted to use a network cable

Article Overview

Yes, a fiber optic router typically requires a network (Ethernet) cable to connect to the Optical Network Terminal (ONT) that converts the fiber signal into electrical signals.

How Fiber Internet Connects to a Router

Fiber optic internet transmits data as light pulses through ultra-thin glass or plastic strands, which cannot be directly interpreted by standard routers. The Optical Network Terminal (ONT) is a crucial device that converts these light signals into electrical signals compatible with your router. The fiber cable from your ISP connects to the ONT, not directly to the router.

Role of the Ethernet Cable

Once the ONT converts the optical signal, a standard Ethernet cable (Cat5e, Cat6, or higher) is used to link the ONT to the router's WAN or Internet port. This cable carries the electrical data from the ONT to the router, enabling your router to distribute internet access to wired and wireless devices in your home or office.

Exceptions

Some modern devices combine the ONT and router into a single unit, often called a combo device. In these cases, the fiber cable plugs directly into the device, and no...
