

Can cable trays be installed inside a cold storage room

Article Overview

Yes, cable trays can be installed in cold storage, but they require proper material selection, support, and protection to ensure safe and reliable operation.

Installation Considerations

Cable trays are commonly used in cold storage facilities to route power and control cables efficiently. In these environments, it is important to avoid direct contact with the ground and provide a stable base for support to prevent mechanical damage and maintain cable integrity . The trays should be positioned to minimize exposure to potential hazards, such as moving equipment or heat sources, and to allow easy maintenance access .

Material Selection

Materials for cable trays in cold storage must withstand low temperatures and potential condensation. Steel, stainless steel, or aluminum trays with appropriate galvanization or corrosion-resistant coatings are recommended . Stainless steel is particularly suitable for environments with high humidity or frequent temperature fluctuations, as it resists corrosion and maintains structural integrity. Galvanized steel can also be used, but care should be taken to ensure the coating is intact to prevent rusting .
