

Configuration of Optical Modules on Aggregation Switches

Article Overview

Optical modules on aggregation switches are configured based on interface type, bandwidth requirements, and compatibility with remote devices, often using interface splitting, link aggregation, and proper module selection.

Interface Types and Module Selection

Aggregation switches support various optical interfaces, such as 10GE, 40GE, and 100GE, which can be connected using QSFP+, SFP+, or other optical modules depending on the switch model and remote device compatibility . For example, a 40GE interface on a Huawei CX320 switch can be split into four 10GE interfaces using a 1-to-4 high-speed cable, active optical cable (AOC), or optical modules with matching wavelengths on the remote device . Cisco ASR 920 routers support SDH and SONET framing on optical modules, with encapsulation options like HDLC, PPP, and ATM AAL0/AAL5, which must be configured per interface module and port .

Interface Splitting and Link Aggregation

High-bandwidth interfaces can be split into multiple lower-bandwidth interfaces to increase flexibility and reduce hardware costs . For instance, a 40GE interface can connect to four 10GE interfaces on a remote switch, either directly via optical modules or using a 1-to-4 AOC. When using link aggregation, multiple optical interfaces can be combined to form a single logical link, improving redundancy, throughput, and load balancing . VLANs can be assigned to aggregated links to seg...
