

# Construction Site Level 3 Power Distribution Box Circuit

## Article Overview

The Level 3 power distribution box, or switch box, directly supplies power to construction site equipment and is the final stage in a three-level distribution system.

### Overview of Three-Level Distribution

A construction site typically uses a three-level power distribution system:

- **First-Level Distribution Box (Main Distribution Box):** Installed near the power source, it receives incoming electricity and distributes it to second-level boxes. It contains the main circuit breaker, main leakage protector, voltmeter, and ammeter for centralized monitoring and control .
- **Second-Level Distribution Box:** Located near high-demand areas or large equipment, it receives power from the first-level box and distributes it to third-level boxes. It includes branch circuit breakers and branch leakage protectors to manage and protect individual circuits .
- **Third-Level Distribution Box (Level 3 / Switch Box):** Positioned close to the equipment it serves, this box directly powers tools, machinery, and temporary lighting. It is the last stage in the distribution chain and ensures safe, localized power delivery .

### Circuit Configuration and Protection

The Level 3 distribution box typically includes:...
