

Control the switch of the distribution box

Article Overview

A distribution box can be controlled using a main switch or individual circuit breakers, allowing you to safely manage power to the entire system or specific circuits.

Main Switch Control

The main switch or main MCB in a distribution box controls the entire electrical supply entering the box. By turning this switch on or off, you can connect or disconnect power to all circuits simultaneously, which is essential for maintenance, emergency shutdowns, or safety purposes. In single-phase domestic setups, this is typically a double-pole MCB rated for the maximum current of the installation, such as 63A in many homes. The main switch receives the incoming phase and neutral wires and distributes power to the busbars, which then feed individual circuit breakers.

Individual Circuit Control

Each circuit in the distribution box is protected by Miniature Circuit Breakers (MCBs) or Residual Current Circuit Breakers (RCCBs). These act as switches for individual loads, such as lighting, outlets, or appliances. Flipping an MCB or RCCB turns the power on or off for that specific circuit, allowing selective control without affecting other circuits. This setup is useful for isolating faulty circuits or performing localized maintenance.
