

Distribution Box Commissioning

Article Overview

The commissioning of a distribution box involves systematic pre-commissioning inspections, electrical testing, and verification of all components to ensure safe and reliable operation.

Pre-Commissioning Checks

- **Physical Inspection:** Verify that the DB is properly installed, mounted at the correct height, and all mechanical components are intact. Ensure all incoming and outgoing cables are correctly terminated, tagged, and identified by location and service type .
- **Documentation Verification:** Confirm that all installation test reports (ITRs), approved drawings, and vendor datasheets are available and accurate .
- **Component Condition:** Check for any damage to breakers, busbars, wiring, or enclosures. Replace or repair damaged components before testing .

Electrical Testing

- **Insulation Resistance (IR) Test:** Measure insulation resistance of all circuits using a megger. Record values for each outgoing circuit; ensure they meet project specifications .
- **Continuity Test:** Verify continuity of all circuits with a multimeter to ensure proper connections and acceptable resistance levels .
- **Polarity Check:** Confirm correct polarity of switches, breakers, and threaded connections to prevent reverse wiring issues .
- **ELCB / RCD Testing:** Test Earth Leakage Circuit Breakers using the recommended current to ensure proper tripping and safety .
- **Breaker Functionality:** Verify that all MCBs, ELCBs, and main switches operate smoothly and match the load and protection requirements
