

Distribution box controls speed

Article Overview

Distribution boxes can control speed either by regulating fluid flow in septic systems using speed levelers or by managing electrical device operation through control boxes.

Speed Control in Septic or Effluent Distribution Boxes

In septic systems, a distribution box evenly distributes effluent from a septic tank to multiple drain field lines. To control the flow rate and ensure uniform distribution, speed levelers are used. These devices are inserted into the outlet pipes of the distribution box and can be hand-adjusted to balance the effluent flow across all lines. This prevents overloading one line while underutilizing others, eliminating the need for re-leveling the system and ensuring efficient operation without excavation or complex adjustments (Tuf-Tite® Speed Levelers™) .

Speed Control in Electrical Systems

In electrical applications, a control box differs from a standard distribution box. While a distribution box primarily divides and protects electrical power across circuits, a control box regulates the operation of connected machinery or devices, including speed control. It contains components such as switches, relays, contactors, and sometimes PLCs or sensors to start, stop, and adjust the speed of motors or pumps. For example, in an industrial setting, a control box can modulate motor speed based on sensor input or programmed logic, enabling automation and precise operation while protecting equipment from abnormal conditions
