

Dry distribution box socket

Article Overview

A dry distribution box socket is an electrical enclosure designed to house and distribute power safely, typically for indoor use, with options for pre-wired or empty configurations.

Overview

A dry distribution box socket is used to organize and distribute electrical power in buildings, particularly in dry environments such as plasterboard walls or ceilings. These boxes provide a secure and neat installation for sockets, switches, and other electrical components, ensuring safety and compliance with electrical standards .

Types and Features

- Empty vs Pre-wired: Empty boxes allow custom wiring, while pre-wired boxes come with built-in sockets like CEE or Schuko® and may include protective devices such as FI (residual current) and LS (circuit breakers) switches .
- Material: Boxes can be made from plastic, metal, or rubber, depending on durability and installation requirements .
- Mounting: Dry lining boxes are designed for cavity walls or plasterboard, with internal lugs and attachments to keep components secure and flush with the wall surface .
- Protection: Some distribution boxes, especially portable or industrial types, offer IP67 protection, making them resistant to dust, moisture, and water ingress .
