

Egyptian Cable Tray Dimensions

Article Overview

Cable tray sizing in Egypt requires spacing between cables equal to twice the diameter of the largest cable, with tray fill and layout following ECC guidelines.

Key Principles for Cable Tray Sizing

-

Cable Spacing: According to the Egyptian Electrical Code, the distance between adjacent cables in a tray should be twice the diameter of the largest cable in that section, not just the cable diameter itself. This ensures proper heat dissipation and reduces the risk of insulation damage due to overheating or mechanical stress .

-

Tray Fill Factor: The ECC specifies that cable trays should not be filled beyond a certain percentage of their cross-sectional area. Typically, 40-50% fill for power cables and up to 60% for control or signal cables is recommended to allow for ventilation and future expansion .

-

Tray Width and Depth: The tray width and depth must accommodate the total number of cables while maintaining the required spacing. The ECC provides tables and formulas to calculate the minimum tray dimensions based on cable diameters, number of cables, and type of insulation .

-

Segregation of Cables: Power, control, and communication cables should be routed separately or with physical barriers to prevent electromagnetic interference and en...
