

Extreme Cold Joint

Overview

Cold weather can cause tissues around the joints to tighten and blood flow to shift toward your core, leading to stiffness and discomfort. Thicker joint fluid and reduced movement in winter also play a role. Many individuals observe that cold weather often coincides with an increase in their joint pain. While the exact reasons for this connection are complex, several scientific theories attempt to explain why some people experience more joint pain when temperatures turn cold. One theory links cold and. Cold weather may trigger or worsen joint pain in certain people, such as those with arthritis or joint replacements. Patients often say they can “feel” a cold front coming before it shows up on the weather report. Some of these may be due to the physical effects of cold temperatures on joints.
