

FC hard drive interface type

Overview

1, FC hard drive FC hard drives refer to disks that use the FC-AL (Fiber Channel Arbitrated Loop) interface mode. Hard disk drives are accessed over one of a number of bus types, including parallel ATA (PATA, also called IDE or EIDE; described before the introduction of SATA as ATA), Serial ATA (SATA), SCSI, Serial Attached SCSI (SAS), and Fibre Channel. Fibre Channel is a high-speed network that is designed for data storage, and it offers much better performance than the SATA or SAS interfaces that are. The hard disk interface is the connecting part between the hard disk and the host computer system, and its function is to transmit data between the hard disk cache and the host memory. But, unfortunately, it cannot be entirely protected from logical failures and human errors. Such issues may bring on the loss of personal user data, applications or even the essential files of the operating. Fibre Channel (FC) is a high-speed data transfer protocol providing in-order, lossless delivery of raw block data. Fibre Channel is primarily used to connect computer data storage to servers in storage area networks (SAN) in commercial data centers. FC-AL enables fiber channel to directly serve as a hard drive connection interface, opening up a pathway for.
