

Fiber Optic Information Box Panel Installation Method

Article Overview

Installing a fiber optic panel box involves careful mounting, cable introduction, routing, and securing to protect fragile fibers and ensure optimal network performance.

Step 1: Mounting the Fiber Optic Panel Box

Begin by determining the installation location and orientation based on rack or wall requirements. For rack-mounted panels, attach brackets to both sides of the distribution box and secure them to the designated rack position using screws, following the EIA-310 standard for 19" or 23" racks if applicable. For wall-mounted or DIN-mounted panels, ensure the surface is stable and capable of supporting the box and fiber load.

Step 2: Introducing Fiber Optic Cables

Once the panel box is mounted, introduce the fiber optic cables through the designated cable inlet holes. Use appropriate grommets or strain reliefs to secure the cables and prevent mechanical stress. Pre-terminated branch fiber jumpers or pigtails are commonly used. Ensure the cable length allows the front panel to be fully extended without tension on the fibers, typically requiring at least 31 inches of slack inside the box.

Step 3: Routing and Managing Fibers...
