

Fiber optic cable cannot be passed through the conduit

Overview

Yes, it is possible and often recommended to run fiber optic cables through conduit. This practice provides several benefits, including protection from physical damage, environmental hazards, and unauthorized access. Fiber optic cable transmits data as light pulses through thin strands of glass or plastic, offering high speed and bandwidth. The hair-thin glass cores within the cable are highly sensitive to physical stress and tight bending, which can cause signal loss or permanent damage. Proper conduit installation requires attention to pulling tension limits, bend radius requirements, lubricant selection, and innerduct. Fiber optic cable now forms the main network backbone of most telecommunication systems because of its efficiency in transmitting massive data within a short time. It forms a critical backbone for modern communication networks across both urban and rural environments.
