

Fiber optic transceiver wirelessly connected to router

Article Overview

A fiber optic transceiver can connect to a router, but it requires an ONT or compatible SFP port, after which the router can distribute the connection wirelessly.

How It Works

Fiber optic internet transmits data as light through glass or plastic fibers, which routers cannot interpret directly. To use this connection wirelessly, the optical signal must first be converted into an electrical signal. This is typically done using an Optical Network Terminal (ONT) or a fiber optic transceiver (SFP module) installed in a router that supports fiber input .

- **ONT/Modem Setup:** The ONT receives the fiber signal from your ISP and converts it to Ethernet. You then connect the ONT to your router's WAN port using a Cat6 or higher Ethernet cable. The router can then broadcast the internet wirelessly throughout your home .
- **SFP Transceiver Setup:** Some routers, like the TP-Link Archer BE800, have SFP+ ports that accept fiber transceivers. You plug the fiber cable into the transceiver, which converts the optical signal for the router. Note that the transceiver often needs to be ISP-approved to function correctly .

Wireless Distribution

Once the fiber signal is converted to an electrical signal via the ONT or SFP transcei...
