

Fiji AI Server SFP

Article Overview

The Fiji AI Server SFP refers to both AI-enabled server setups for Fiji/ImageJ image analysis and high-performance AI/HPC servers, enabling automated microscopy image processing and large-scale computation.

AI-Enabled Fiji/ImageJ Server

The Fiji MCP (Multi-Channel Processing) server allows AI agents to interact with Fiji/ImageJ in plain English, automating image analysis tasks without requiring macro coding knowledge. Users can open images, apply filters like Gaussian blur, threshold bright spots, outline objects, measure areas and circularity, skeletonize masks, and summarize structures directly through AI agents such as Cursor, Claude, or Gemini (). Requirements and Setup:

- Python 3.10+ installed
- Fiji/ImageJ installed on the local machine
- Java (required by PyImageJ)
- Correct path to the Fiji folder containing jars/ and plugins/
- First startup may take 30-90 seconds as the JVM loads () Once connected, users can instruct the AI server with commands like:
 - "Open ./images/cells.tif and tell me the dimensions"
 - "Apply a Gaussian blur with sigma 4 and show me the result"
 - "Count the bright objects and give me their areas" The server acts as a Python wrapper for Fiji functions, facilitating communication between AI agents and ImageJ plugins ()....
