

Finished cable tray dimensions

Article Overview

Standard finished cable tray dimensions vary by type, with widths from 50mm to 900mm, depths from 50mm to 150mm, and lengths typically 3 meters, designed to accommodate cable fill, heat dissipation, and structural load requirements.

Standard Widths and Depths

Cable tray widths are selected based on the number and size of cables to be installed. Common widths range from 50mm for small data lines to 900mm for large industrial power runs. Depths (side rail height) typically range from 50mm to 150mm, ensuring cables are held securely and allowing proper airflow for heat dissipation. Wider trays improve airflow and ease of cable pulling, while deeper trays increase vertical stacking capacity but may not always be the most efficient for airflow or installation .

Typical Lengths

Cable trays are manufactured in straight sections for ease of transport and installation. Standard lengths are 3 meters (10 feet), though some manufacturers offer lengths up to 12 meters (40 feet) for long-span outdoor installations. Shorter spans are supported every 6-8 feet indoors, while longer spans may require supports every 14-20 feet depending on load and environmental conditions .

Material Thickness

Material thickness affects load capacity, allowable span, and long-term durability. S...
