

Fireproof cable trays and power lines

Article Overview

Fireproof cable trays are specialized systems designed to maintain power line functionality during fire events, using fire-resistant materials and coatings to protect cables from heat, flames, and environmental hazards.

Overview

Fireproof cable trays are engineered to support and protect electrical cables while providing fire resistance to ensure continuous operation of power lines during emergencies. They are widely used in power plants, substations, industrial facilities, hospitals, airports, and nuclear installations where maintaining electrical supply is critical .

Types and Construction

- Intumescent Fire-Resistant Trays
 - Constructed with epoxy-based intumescent coatings that expand under high temperatures to form an insulating char layer, reducing heat transfer to cables .
 - Often reinforced with internal metal plates to enhance structural stability and support long-span installations.
 - Designed to allow ventilation, preventing heat accumulation and cable aging.
- Fire-Resistant Ladder and Solid Trays
 - Standard or lightweight trays with fireproof coatings or fire-resistant materials.
 - Can be installed with surface cable laying for easy access and maintenance .
 - Tested according to EN 1363-1 and other international fire standards to ensure reliability under fire conditions
