

Gigabit Fiber Router Bridging Settings

Article Overview

Bridge mode allows your fiber router to pass the internet connection to a secondary router, disabling its own routing functions to prevent conflicts and optimize network performance.

What is Bridge Mode?

Bridge mode is a network setting that disables the router functionality of your fiber gateway, effectively turning it into a modem-like device that forwards all traffic to another router. This prevents issues caused by having multiple devices performing NAT, DHCP, or firewall functions simultaneously . It is particularly useful when:

- You want to use a personal router for advanced Wi-Fi, security, or custom network configurations .
- You have a modem/router combo and need to bypass its built-in routing features .
- You need to maintain a single subnet across your network for devices and switches . Bridge mode may also be referred to as IP Passthrough or Bypass Mode, which essentially provide the same functionality but with slight differences in configuration options .

When to Enable Bridge Mode

You should enable bridge mode if:

- You are connecting a personal router to your fiber service and want it to manage Wi-Fi and network settings
