

How to configure two routers for fiber optic connections

Article Overview

You can connect two routers to a single fiber optic modem by using the first router as the primary gateway and the second router as an access point or secondary network, ensuring proper IP configuration and DHCP management.

Understanding the Setup

Fiber optic internet uses an Optical Network Terminal (ONT) to convert light signals into data your routers can use. Typically, your ISP provides a single ONT or a modem-router combo. The primary router connects directly to the ONT and manages the internet connection, while the secondary router extends the network or creates a separate segment.

Recommended Connection Methods

- LAN-to-WAN Connection (Secondary Router in Router Mode)
 - Connect the ONT to the WAN port of the primary router.
 - Connect a LAN port of the primary router to the WAN port of the secondary router using an Ethernet cable.
 - Configure the secondary router in router mode if you want a separate subnet, but this may create a double NAT scenario, which can affect gaming or VPNs.
- LAN-to-LAN Connection (Secondary Router as Access Point)
 - Connect a LAN port of the primary router to a LAN port of the secondary router.
 - Disable DHCP on the secondary router to prevent IP conflicts....
