

How to connect the barrier gate to the internet via a switch

Article Overview

You can connect a barrier gate to the internet by linking its network interface to a switch, configuring its IP settings, and ensuring proper power and network access.

Step-by-Step Guide

1. Identify the Network Interface Open the top cover of the barrier gate host to locate the network port, usually an RJ45 Ethernet interface, intended for connecting peripheral devices or management systems . 2. Connect to the Switch Use a standard Ethernet cable to connect the barrier gate's network port to an available port on your network switch. Ensure the switch is powered and connected to your local network or router that provides internet access. 3. Configure IP Settings

- Assign a static IP address to the barrier gate or enable DHCP if your network supports it.
- Ensure the IP address is within the same subnet as your network to allow communication with other devices and remote management software.

4. Power the Barrier Gate Make sure the barrier gate is powered on according to the manual specifications (typically 220 VAC $\pm 10\%$) and that the network interface is active . 5. Test Connectivity

- Ping the barrier gate's IP address from a computer on the same network to verify connectivity.
- Access the barrier gate's web interface or management software to confirm it is reachable over the network.
