

How to connect the fiber optic panel two-in-one

Article Overview

Two fiber optic panels can be connected using patch cords and adapters, ensuring low signal loss and flexible network management.

Recommended Method

The safest and most standardized way to connect two fiber optic panels is not by splicing inside the panels, but by using fiber patch cords and adapters. This approach maintains network performance, allows easy reconfiguration, and complies with telecom standards. The typical connection structure is: Panel A → Adapter → Patch Cord → Adapter → Panel B

Key Components

- Patch Cords: Short, flexible fiber cables that link adapters on each panel. They allow easy maintenance and testing.
- Adapters/Couplers: Devices that align and join fiber connectors (e.g., SC to SC, LC to LC, or hybrid types). They ensure minimal insertion loss and secure connections.
- Connector Types: Ensure the connectors on the patch cords match the panel ports (SC, LC, FC, ST). Mismatched types (e.g., APC to UPC) can cause reflection and signal loss.
