

How to cut tail fibers quickly and efficiently

Overview

There are many factors to adjust, set and monitor for efficient tail threading, including air blow and vacuum pressures, conveyor belt speeds and speed differences, tail width and position and tension of the tail. Cutting tails in dovetail joints is the stage where the quality of the joint depends directly on controlling the cutting angle and your sawing technique. The most important factor is achieving a square cut on the end grain of the workpiece – this determines how well the joint will fit. To aid in the disposal of the rope, the Ragger can be used with a hydraulic rag tail cutter with a 30-inch square. Tails first —One advantage to cutting tails first is the ability to gang tail boards together and cut two or four sets of tails at once. With the boards clamped, use a mechanical pencil or a sharp pencil with a flat on one side to trace the pins onto the board. Pins first —On a normal-size project. When you have total tail control throughout the machine it clearly enhances production line efficiency. Today's tail cutters need to offer safety in operation, increasing automation and, above all, smooth web feeding guiding. I have one such rafter tail here: This is a 3-1/8" thick glulam and I need to rip cut it.
