

How to disconnect the fiber optic cable

Article Overview

Fiber optic cables can be disconnected using connector removal for temporary disconnections or by carefully cutting and splicing for permanent disconnections, with attention to minimizing signal loss and protecting the fiber.

Temporary Disconnection: Connector Removal

Fiber optic connectors (SC, LC, ST, FC, etc.) provide a pluggable interface that allows fibers to be disconnected and reconnected without permanent damage. To safely disconnect a fiber:

- **Power Down Equipment:** Always ensure the optical signal is turned off to prevent eye damage.
- **Clean the Connector:** Dust or debris can damage the fiber endface or increase insertion loss.
- **Gently Unplug:** Pull the connector straight out from the adapter or port, avoiding twisting or bending the fiber sharply.
- **Cap the Fiber:** Use protective caps to prevent contamination or physical damage to the exposed fiber end. Connector disconnection is ideal for patch panels, equipment interfaces, or temporary network reconfigurations. Pre-terminated patch cords and pigtails are often used to simplify this process while maintaining low insertion loss.

Permanent Disconnection: Cutting and Splicing

For permanent disconnections or network reconfigurations:...
