

How to disconnect the power to the distribution box

Article Overview

To safely disconnect power to a distribution box, first turn off the main breaker, verify de-energization, and then operate the disconnect switch according to its type and wiring orientation.

Step-by-Step Procedure

1. Locate the Main Service Disconnect Identify the main service disconnect, which is typically near where the utility's conductors enter the building. For residential setups, this may be an outdoor emergency disconnect required by NEC 230.70 and 225.41, ensuring first responders can access it safely .

2. Turn Off the Main Breaker Before opening the distribution box, switch the corresponding double-pole circuit breaker to the “Off” position at the main service panel. This ensures the incoming power to the disconnect box is de-energized .

3. Verify De-Energization Use a voltage tester or multimeter to confirm that no electrical potential exists on the incoming wires. Residual voltage can be lethal, so this verification is critical .

4. Identify Disconnect Box Type

- Non-fused disconnects: Act as a mechanical switch to isolate the circuit. Common in residential settings where overcurrent protection is provided elsewhere....
