

How to implement a Fiber Channel solution

Overview

This document explains how to design highly available Fibre Channel networks. Such a design requires switches with an appropriate hardware design architecture, a solid software implementation, a careful selection of fabric topology, and adherence to implementation best. The Fibre Channel Industry Association (FCIA) is a non-profit international organization whose sole purpose is to be the independent technology and marketing voice of the Fibre Channel industry. We are committed to helping member organizations promote and position Fibre Channel, and to providing a. Fibre Channel is a high-speed network technology used to connect server to data storage area network. It supports data backup and replication. Its intricate design and robust performance enable storage area networks (SANs) to operate with remarkable speed and reliability, overcoming limitations of legacy. Fiber network design is only possible with appropriate networking equipment, such as fiber optic cables, connectors, termination boxes, splicing equipment, and active components (for example, switches and routers). Operators while selecting needed equipment consider capacity, reliability.
