

How to make a router using fiber optic cables

Article Overview

You cannot make a router directly from fiber optic cables; instead, you connect a fiber optic line to a router via an Optical Network Terminal (ONT) that converts light signals into electrical signals your router can use.

Required Equipment

- Optical Network Terminal (ONT): Converts fiber optic light signals into Ethernet signals compatible with routers . Usually provided by your ISP.
- Fiber optic cable: Typically single-mode with SC/APC or SC/UPC connectors .
- Fiber-ready router: Ensure it has a WAN or SFP port to accept Ethernet input from the ONT .
- Ethernet cable (Cat6a or higher): Connects the ONT to the router to maintain high-speed data transfer .

Step-by-Step Setup

- Locate the fiber wall outlet: This is where your ISP's fiber line enters your home or office .
- Connect the fiber optic cable to the ONT: Remove protective caps, align the connector, and insert it until it clicks securely .
- Power on the ONT: Wait 2-5 minutes for the status lights to stabilize, indicating a successful connection .
- Connect the ONT to your router: Use an Ethernet cable from the ONT's LAN port to the router's WAN port
