

How to separate fiber optic cables

Article Overview

Fiber optic cables can be separated or split using optical splitters and precise splicing techniques, but the process requires specialized tools and careful handling to maintain signal integrity.

Understanding Fiber Optic Splitting

Fiber optic cables consist of a core, cladding, and protective layers that transmit data as light signals. Splitting a fiber allows a single optical signal to be distributed to multiple devices or locations. There are two main methods:

- **Passive Splitting:** Uses an optical splitter to divide the light signal into multiple paths without amplification. Common in local networks and FTTH deployments, splitters come in configurations like 1:2, 1:4, 1:8, or higher, depending on the number of outputs needed .
- **Active Splitting:** Uses devices such as optical switches or optical add-drop multiplexers (OADM) to split and amplify signals, suitable for long-haul networks .

Tools and Equipment Needed

To split fiber optic cables safely and effectively, you will need:

- **Fiber Optic Splitter:** Divides the signal into multiple outputs .
- **Fiber Optic Splicer:** Joins fibers with minimal signal loss; fusion splicers are preferred .
- **Fiber Optic Cleaver:** Provides precise, perpendicular cuts for optimal splicing
