

How to thread cables after the cable tray is installed

Article Overview

Cables can be threaded into an installed cable tray by planning the route, using cable rollers or pull ropes, maintaining proper spacing, and securing cables at regular intervals to prevent damage and ensure compliance.

Step-by-Step Process

1. Plan the Cable Route Before threading, review the tray layout and identify entry and exit points, bends, and junctions. Ensure the tray is free of obstructions and that the cable path avoids sharp edges or tight bends that could damage insulation .
2. Use Pulling Aids For long runs, employ cable pull ropes, fish tapes, or cable rollers. Rollers reduce friction and prevent kinks, especially in ladder-type trays where cables may need to traverse long horizontal distances . For vertical or angled sections, consider using a rope or pulling line to guide the cable smoothly.
3. Maintain Proper Bend Radius Avoid excessive bending, which can damage the cable. Follow manufacturer specifications for minimum bend radius, typically several times the cable diameter. Ladder trays allow airflow and easier bending, while solid-bottom trays may require more careful handling .
4. Organize and Separate Cables Group cables by type (power, data, control) and maintain spacing to prevent overheating. Use cable ties, clamps, or Velcro straps at regular intervals to secure cables without compressing them. Avoid overfilling the tray; cable fill should generally not exceed 40% of tray capacity .
5. Label and Identify Cables Install markers or labels at entry, exit, and junction points for easy identification and future maintenance. This ensures compliance with technical standards and simplifies troubleshooting .
6. Inspect and...
