

How to use hot melt adhesive for optical cable sheathing

Overview

Hot Melt connectors use a “hot melt” adhesive preloaded into the connector. The termination process involves heating up the connector until the adhesive becomes a liquid, then inserting the stripped and cleaned fiber. Fiber optic connector manufacturers have been working for over 30 years to make terminating optical fiber easier, faster and cheaper, and they have done a really good job. But perhaps they have been overselling the simplicity of fiber optic termination. See the FOA Virtual Hands-On for the process of fiber optic. Field termination may use adhesive/polish techniques with either heat-cured epoxy, room temperature cured epoxy, anaerobic adhesives or HotMelt (a 3M product name) or prepolished/splice connectors which have a short stub of fiber inside the connector that are attached with mechanical or fusion. The Hot Melt connectors utilize an advanced adhesive technology eliminating the application of epoxy.
