

How to wire the jumper terminals in a distribution box

Article Overview

Use properly sized terminal block or circuit breaker jumpers to connect multiple terminals, ensuring secure electrical continuity and adherence to current ratings.

Understanding Jumpers

Jumpers are conductive links used to connect multiple terminal blocks or circuit breakers in a distribution box. They allow a single input wire to distribute power or signals to multiple outputs without running separate wires to each terminal . Jumpers come in various types:

- Terminal block jumpers: Designed for DIN rail-mounted terminal blocks; can be screw-terminal or spring-loaded .
- Circuit breaker jumpers: Specifically designed to connect multiple breakers; must match the breaker type and current rating .
- Custom jumpers: Can be created by modifying standard jumpers or using wires with ring terminals for unique configurations .

Steps to Wire Jumpers

- Select the Correct Jumper: Ensure the jumper is compatible with the terminal block or breaker type and rated for the expected current .
- Plan the Connection: Identify which terminals need to be linked. Only connect the terminals required for your distribution to avoid unnecessary connections .
- Insert the Jumper: For terminal blocks, insert the jumper into the designated slots,...
