

Installation diagram of current switch in distribution box

Article Overview

A current switch is installed by mounting the split-core sensor over the conductor in the distribution box and connecting its dry-contact terminals to the monitoring circuit.

Placement and Mounting

The current switch, typically a split-core sensor, should be installed over the conductor you want to monitor. Open the sensor, place it around the live or phase conductor, and close it until it latches, ensuring the two halves are properly aligned. Dirt or misalignment can impair operation, so keep the sensor clean. The switch can be mounted in a suitable location inside the distribution box using the two mounting holes on its base .

Wiring Connections

- The current switch has two screw terminals for connection to the monitoring circuit.
- The output is a dry contact, normally open, which closes when the monitored current exceeds the trip value.
- The switch is not polarity sensitive, so either terminal can be connected to the control or alarm circuit .
- For increased sensitivity, the conductor can be looped multiple times through the sensor, but this reduces the maximum measurable current proportionally .
