

Installation of Explosion-proof Distribution Box and Power Strip

Article Overview

Explosion-proof power strips in distribution boxes must be installed following strict safety standards, proper grounding, certified cabling, and precise mounting to ensure safe operation in hazardous environments.

Preparation and Safety Measures

Before installation, ensure the power supply is completely turned off to prevent electrical hazards. Only use cables, connectors, and components certified for explosion-proof applications (EX or ATEX markings), resistant to flame, impact, and mechanical damage. Verify that the distribution box's explosion-proof rating matches the hazardous area classification (e.g., Zone 1, Zone 2, Zone 21, Zone 22) to prevent catastrophic failure. Unauthorized modifications to the box or its components are strictly prohibited.

Mounting and Positioning

- Install the distribution box in a dry, ventilated, and accessible area, away from heat sources, collision risks, and moisture.
- Maintain a standard installation height of approximately 1.8 meters for convenient operation.
- Ensure the box is level and vertical, with a maximum inclination of 5 degrees.
- Secure the box to the foundation using bolts and, if necessary, shims to achieve precise alignment. Neighboring boxes should have minimal height differences ($\leq 2\text{mm}$).
