

Installation of cable trays against the wall in vertical shafts

Article Overview

Cable trays can be installed vertically against walls, but careful consideration of support, cable spacing, and heat dissipation is required to ensure safety and functionality.

Feasibility and Considerations

Cable trays are designed primarily for horizontal runs, but vertical installations are possible. When placing a tray against a wall:

-

Support and Stability: Vertical trays must be securely anchored to the building structure. Supports should be spaced preferably less than 2 meters apart to prevent sagging and maintain cable stability . Ladder-type trays provide convenient rungs for tying down cables in vertical runs .

-

Cable Positioning: Simply turning a horizontal tray on its side is not recommended. In such a configuration, cable ties alone must prevent cables from sliding, which can lead to piling, uneven load distribution, and potential de-rating of cable ampacity . Specialized vertical cable rack systems with hooks or rails are preferred for vertical stacking of horizontal cable runs .
