

Installation of distribution box pre-embedded

Article Overview

A pre-embedded distribution box should be installed level, securely embedded in the wall, properly grounded, and supported to ensure safety, accessibility, and long-term reliability.

Preparation and Storage

Before installation, disassemble the box cover and panel, mark them for storage, and store according to installation sequence to prevent damage or paint peeling. Numbering the components ensures correct placement during installation. Ensure the installation site is dry, accessible, and at the correct height—typically 1.5m from the ground for the box bottom edge, and at least 1.8m for the distribution board installation panel.

Embedding and Positioning

- Place the box flat and vertical, with a deviation of no more than 3mm, ensuring the panel edges are flush with the wall and not recessed or protruding.
- For boxes wider than 500mm, install concrete lintels on top; for widths over 300mm, use reinforced brick lintels to prevent pressure damage.
- Fill the surrounding space with cement mortar to secure the box firmly.
- For wall-mounted boxes, drill bolt holes or embed wood bricks as needed, and knock out holes for cable entry according to actual requirements
