

Ladder-type cable trays are suitable for use

Article Overview

Ladder-type cable trays are primarily used to support and organize power, control, and instrumentation cables in industrial and commercial installations, offering excellent ventilation and load-bearing capacity.

Overview

Ladder-type cable trays consist of two longitudinal side rails connected by transverse rungs, forming a ladder-like structure that supports cables while allowing air circulation to prevent overheating . They are designed according to IEC 61537 standards, ensuring mechanical strength, safety, and compatibility with various cable types . These trays are not intended for use as walkways or for supporting personnel, as this can damage the system and compromise safety .

Typical Applications

- **Industrial Facilities:** Ladder trays are widely used in petrochemical plants, refineries, and thermal power stations where long horizontal runs of large power cables are required .
- **Commercial Buildings:** They are suitable for overhead cable routing in large commercial spaces, providing easy access for maintenance and future expansion .
- **Instrumentation and Control Systems:** Ladder trays support both power and instrumentation cables, ensuring separation and organization while maintaining safe operating temperatures
