

Location of power connection holes in the distribution box

Article Overview

Power connection holes in a distribution box are typically located at the top or rear for incoming supply (phase and neutral), with dedicated terminals for earth, neutral, and outgoing circuits.

Incoming Power Connections

The main power supply enters the distribution box through the main MCB or main switch, usually a double-pole MCB for single-phase systems. The phase (live) and neutral wires are connected to the input terminals of this main MCB, which is often positioned at the top or center of the box for easy access. In high-current or industrial boxes, such as Powersafe units, the earth connection is made first through a dedicated earth socket, followed by neutral and phase connections in a sequential manner to ensure safety.

Outgoing Circuit Connections

From the main MCB, power is distributed to branch MCBs or RCCBs. The output terminals of the main MCB connect to the input terminals of the RCCB, and the output of the RCCB feeds the single-pole MCBs for individual circuits. The neutral wires from the loads are connected to a neutral link bar, while the earth wires are connected to an earth link bar. These link bars are usually located along the side or bottom of the distribution box for organized wiring
