

Logarithmic optical fiber

Overview

Optical fibers with a logarithmic index profile can provide invariant mode field diameters along a tapered fiber, which enables adiabatic mode transitions for higher-order mode (HOM) microfibers. They are defined as decibels relative to a reference power level of 1 mW. It is thus a dimensionless unit, actually specifying a power ratio rather than a power. For example, 0 dBm corresponds to 1 mW, 10 dBm to 10 mW and 20 dBm to 100 mW. caused. This work presents a low-complexity digital backpropagation (DBP) implementation approach based on step size distribution that uses a binary logarithmic step size method to achieve high data rate optical transmission.
