

MPO Fan-Shaped Fiber Optic Patch Cord Test

Overview

For example, an Optical Loss Test Set (OLTS) can be used to measure length, optical loss, and check polarity of MPO links by using fan out cables that break the MPO down to individual LC or SC connectors. However, this process adds significant complexity to the test process, as well as expensive. The 5G network, FTTX (Fiber to the X), and IoT (Internet of Things) accelerate the development and expansion of fiber optic networks, increasing the demand for fiber optic cables. These connectors named Single Fiber Coupling (SC) and Multifiber Push-On (MPO). The compact size and easy push-pull installation were major advantages simultaneously. Since the early MPO connectors have been widely adopted by carrier interconnect routing. The ability to bundle. Prefab cable systems and parallel array transmission systems for 40G/100G on multimode fiber generally use a multifiber array connector called a MPO or sometimes by a trade name MTP. MPO patch cable wiring must meet the TIA/EIA-568-C. 3 standard and after 1000 plug-ins and unplugs, the IL change is ≤ 0 . Testing becomes less obvious under these various situations.
