

Mauritius Anti-oxidation Cable Tray Standards

Article Overview

In Mauritius, anti-oxidation cable trays are typically hot-dip galvanized steel trays, and compliance with Mauritian Standards Bureau (MSB) regulations is recommended.

Overview of Anti-Oxidation Cable Trays

Anti-oxidation cable trays are designed to resist corrosion and extend service life in industrial, commercial, and infrastructure projects. In Mauritius, hot-dip galvanizing (HDG) is the most common method for providing anti-corrosion protection. HDG involves immersing steel trays in molten zinc, forming a protective layer that prevents rust and oxidation, which is particularly important in humid or coastal environments. Perforated HDG trays also improve heat dissipation and reduce dust accumulation, making them suitable for control, communication, and power cables.

Mauritian Standards

The Mauritius Standards Bureau (MSB) maintains a catalogue of national standards, including those related to electrical installations and cable management systems. While the exact standard number for anti-oxidation cable trays is not publicly listed online, MSB standards typically cover:

- Material specifications (e.g., steel grade, thickness, galvanizing requirements)
- Mechanical and electrical performance
- Corrosion resistance and environmental durability...
