

Molded Energy-Saving and High-Efficiency Cable Trays

Article Overview

Energy-saving molded cable trays reduce material use, lower energy consumption, and improve structural performance while simplifying installation.

Material and Energy Efficiency

Energy-saving molded cable trays are designed with structural optimization, using a mold-press forming process that creates a seamless, one-piece tray with strong integrity. Their thin-walled steel with reinforcing ribs is 20%-40% lighter than traditional steel trays, which reduces material consumption and energy required for production. The concave-convex design further saves over 40% of materials compared to conventional trays, contributing to both cost and energy savings.

Enhanced Load-Bearing and Structural Performance

The molded design, particularly the reinforced bottom with ribs, significantly increases the axial moment of inertia and bending stiffness, allowing a 1.0 mm thick tray to support 2-3 times the load of traditional trays. This makes them suitable for heavy cable installations without compromising safety or durability.

Corrosion Resistance and Longevity

Energy-saving molded trays often feature surface treatments such as color steel organic coatings or bimetallic inorganic coatings, enhancing corrosion resistance an...
