

Moroccan optical cable reinforcing core

Article Overview

Moroccan fiber optic cables, such as those produced by FBR Cables, use high-performance reinforcing cores designed for durability, tensile strength, and long-distance deployment.

Overview of Moroccan Fiber Optic Cable Production

Morocco has significantly expanded its domestic fiber optic cable production, with FBR Cables leading the sector. Their new industrial facility in Berrechid, inaugurated in 2026, spans 15,000 m² and has an annual production capacity of 70,000 kilometers of fiber optic cables, covering approximately 60% of national demand . The facility is fully Moroccan-owned and equipped with state-of-the-art technology, supporting indoor, outdoor, aerial, and long-distance network deployments .

Reinforcing Core in Fiber Optic Cables

The reinforcing core in fiber optic cables is a critical component that provides mechanical strength, protects the optical fibers from tension, bending, and environmental stress, and ensures reliable signal transmission over long distances. While specific Moroccan cable designs are proprietary, standard reinforcing cores typically include:

- Aramid yarn (Kevlar): Provides high tensile strength while remaining lightweight, commonly used in indoor and outdoor cables.
- Steel wire or stranded steel: Used in aerial or long-distance cables to support weight and resist environmental stress....
